

— COMPANY OVERVIEW

10+ years of SAP finance experience and SAP cloud architecture

Deep expertise across the SAP finance modules and a genuinely neutral read on the cloud models — so the decision you take is one you can defend with its reasoning.

An independent consultancy, specialised end to end in SAP finance

FOUNDED

2021

HEAD OFFICE

Istanbul

REGIONS SERVED

Türkiye, EMEA and the United States

CPeak Consultancy works end to end on the finance modules across SAP ECC, S/4HANA on-premise, Private Cloud and Public Cloud. Our focus is a senior team and an AI-supported way of working.

The common model in SAP consulting is to offer broad scope and then source a different specialist for each area. We took the opposite position: if we take an engagement, we are not subcontracting the difficult part of it.

Where a programme extends into logistics modules outside our specialism, we work alongside partners in Türkiye and abroad so that the finance scope stays covered end to end.

Rather than running many programmes in parallel, we run the number that allows senior people to be genuinely present on each.

EXPERIENCE

10+ years in SAP finance

EXPERTISE

Depth across FI and CO

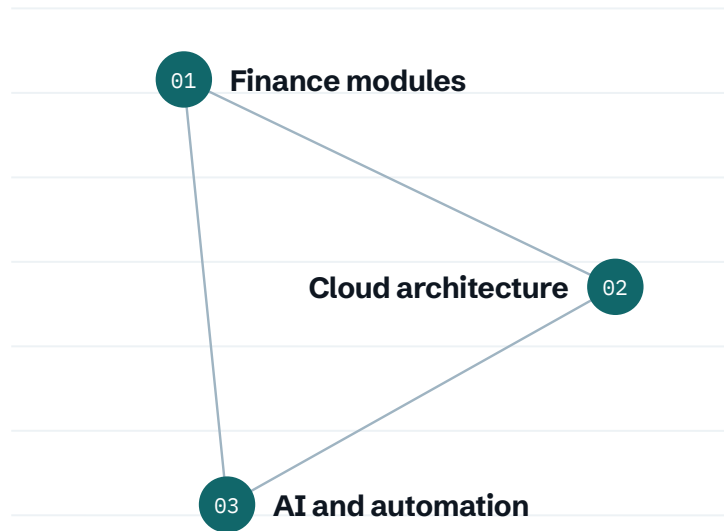

INDEPENDENCE

Public vs Private Cloud, vendor-neutral

TEAM

Senior consultants only

Three areas of expertise, and each one informs the others

One discipline, not three practices sold beside each other
— a cloud decision is a finance decision here.

01

Finance modules

SAP FI, CO, PA (MARGIN ANALYSIS) AND PS (PROJECT SYSTEM)

Enterprise structure and global chart of accounts design, controlling and profitability, and redesign of the financial close.

02

SAP cloud architecture

PRIVATE CLOUD AND PUBLIC CLOUD

Fit assessment between the two models, target architecture design and migration management. We do not advocate for a particular model.

03

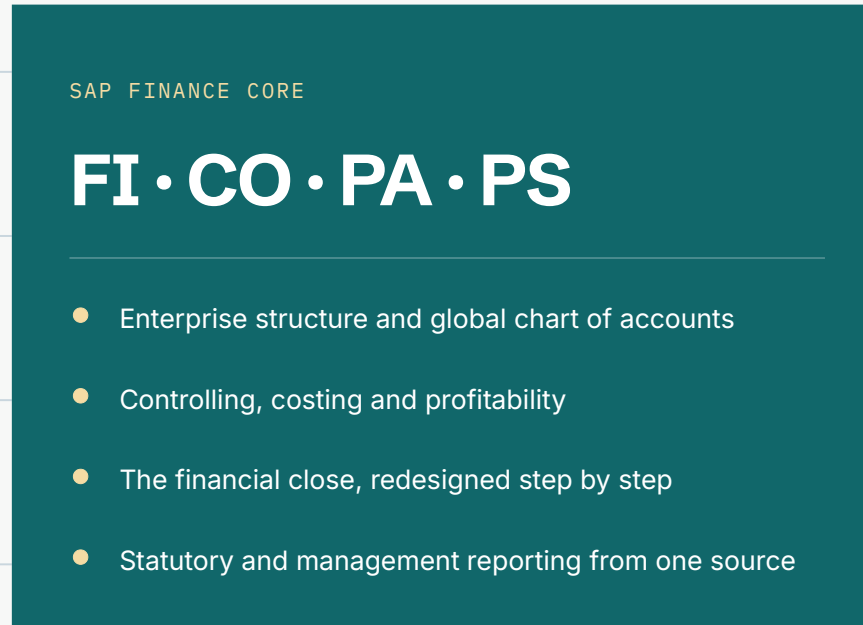

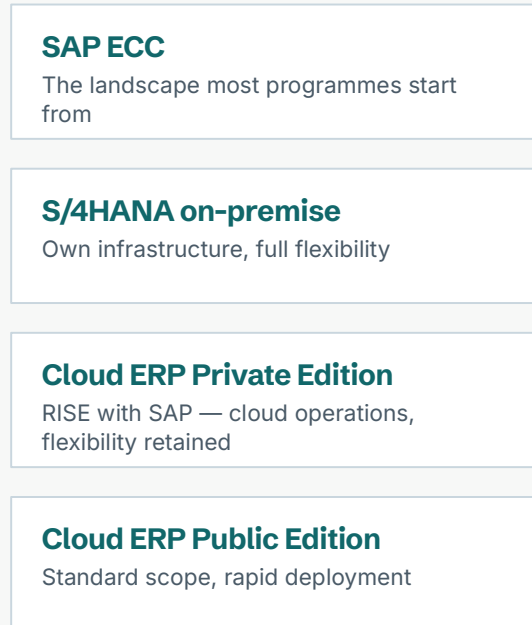

AI and RPA-powered automation

EMBEDDED IN SAP, NOT BOUGHT BESIDE IT

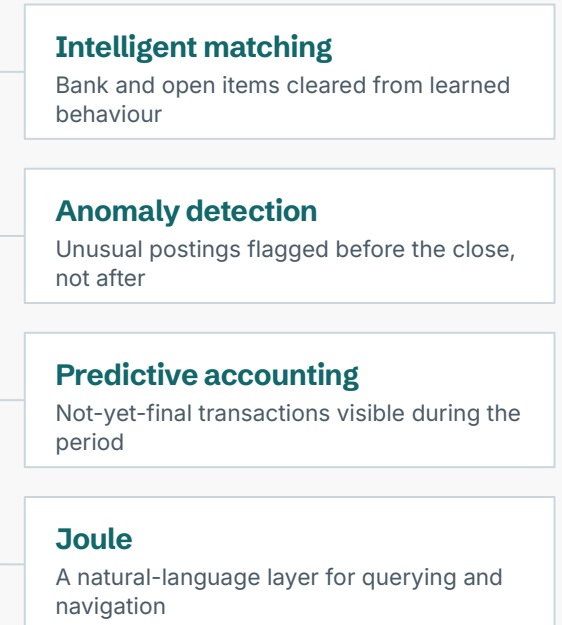

Matching, anomaly detection and predictive accounting using SAP's embedded AI capabilities — measured first, then phased.

One finance core, four deployment models, one embedded AI layer

DEPLOYMENT MODELS

EMBEDDED AI CAPABILITIES

SAP's AI capabilities are embedded in the system rather than bought separately. Enabling all of them is not a strategy — we assess which ones your data volume and process discipline can support, and sequence them.

Five service areas, one finance perspective

The same organisation often sits in more than one category. This table exists to show which piece of work makes more sense to start with.

SOLUTION	WHO IT SUITS	TYPICAL DURATION	PRIMARY BENEFIT
SAP Finance Modules FI, CO and end-to-end financial process design	Organisations with a drifted SAP setup, or implementing fresh	Diagnosis 3–4 weeks Redesign 4–7 months	Consistent reporting and a predictable close
S/4HANA Transformation Brownfield, greenfield or selective transition	Organisations on ECC that need a conversion plan	Assessment 4–6 weeks Conversion 6–14 months	A defensible approach decision and a predictable cutover
SAP Public Cloud Cloud ERP Public Edition architecture and delivery	Companies able to adopt standard, wanting fast deployment	Assessment 2–3 weeks Deployment 3–5 months	Rapid go-live and low operational overhead
SAP Private Cloud RISE with SAP and Cloud ERP Private Edition	Larger organisations that must retain process flexibility	Preparation 5–8 weeks Migration 7–14 months	Cloud operations without giving up flexibility
AI in Finance SAP's embedded AI capabilities and process automation	Teams spending heavy manual hours on repetitive finance work	Assessment 2–3 weeks First phase 6–12 weeks	Recovered hours and errors caught earlier

Public or Private Cloud — the most expensive decision to reverse

Not the advanced and the cheap version of one another, but different trades.

	Public Cloud CLOUD ERP PUBLIC EDITION	Private Cloud CLOUD ERP PRIVATE EDITION
Cost model	Subscription by user and scope. Infrastructure, operations and upgrades included.	Subscription varying with sizing. Customisation maintenance and upgrade testing stay in your budget.
Extensibility	The core cannot be modified. Extension only through supported mechanisms, in a separate layer.	Broad flexibility including core modification. Existing ABAP developments can be carried across.
Upgrade cadence	Regular and automatic. Upgrades are not optional and cannot be deferred.	You largely control the timing. Each release upgrade is planned as its own project.
Implementation time	Short — a single-country finance deployment typically takes 3–5 months.	Longer — typically 7–14 months, depending on scope and inherited landscape.
Typical fit	Mid-market organisations close to standard, and subsidiaries on a group template.	Larger organisations carrying substantial customisation and integration history.

We do not advocate for a model. We compare your processes against standard scope and put the cost and the constraint of both models side by side for your situation. The decision stays yours.

Measurement first, then a decision you can defend

The outcome is decided by the weekly working discipline, not by the name of the methodology.

01 MEASURE

No recommendation is made without reading the actual system data. Advice given without measurement is a guess, and its cost falls to you.

02 COMPARE

Options placed side by side with cost, duration and risk — together with our own view and the reasoning behind it.

03 DECIDE

The decision is yours and the reasoning stays on paper. That is what answers “why did we do it this way?” two years later.

04 OWN

Test scenarios written together, the first close run together, documentation left in a form people actually use.

Bad news travels immediately

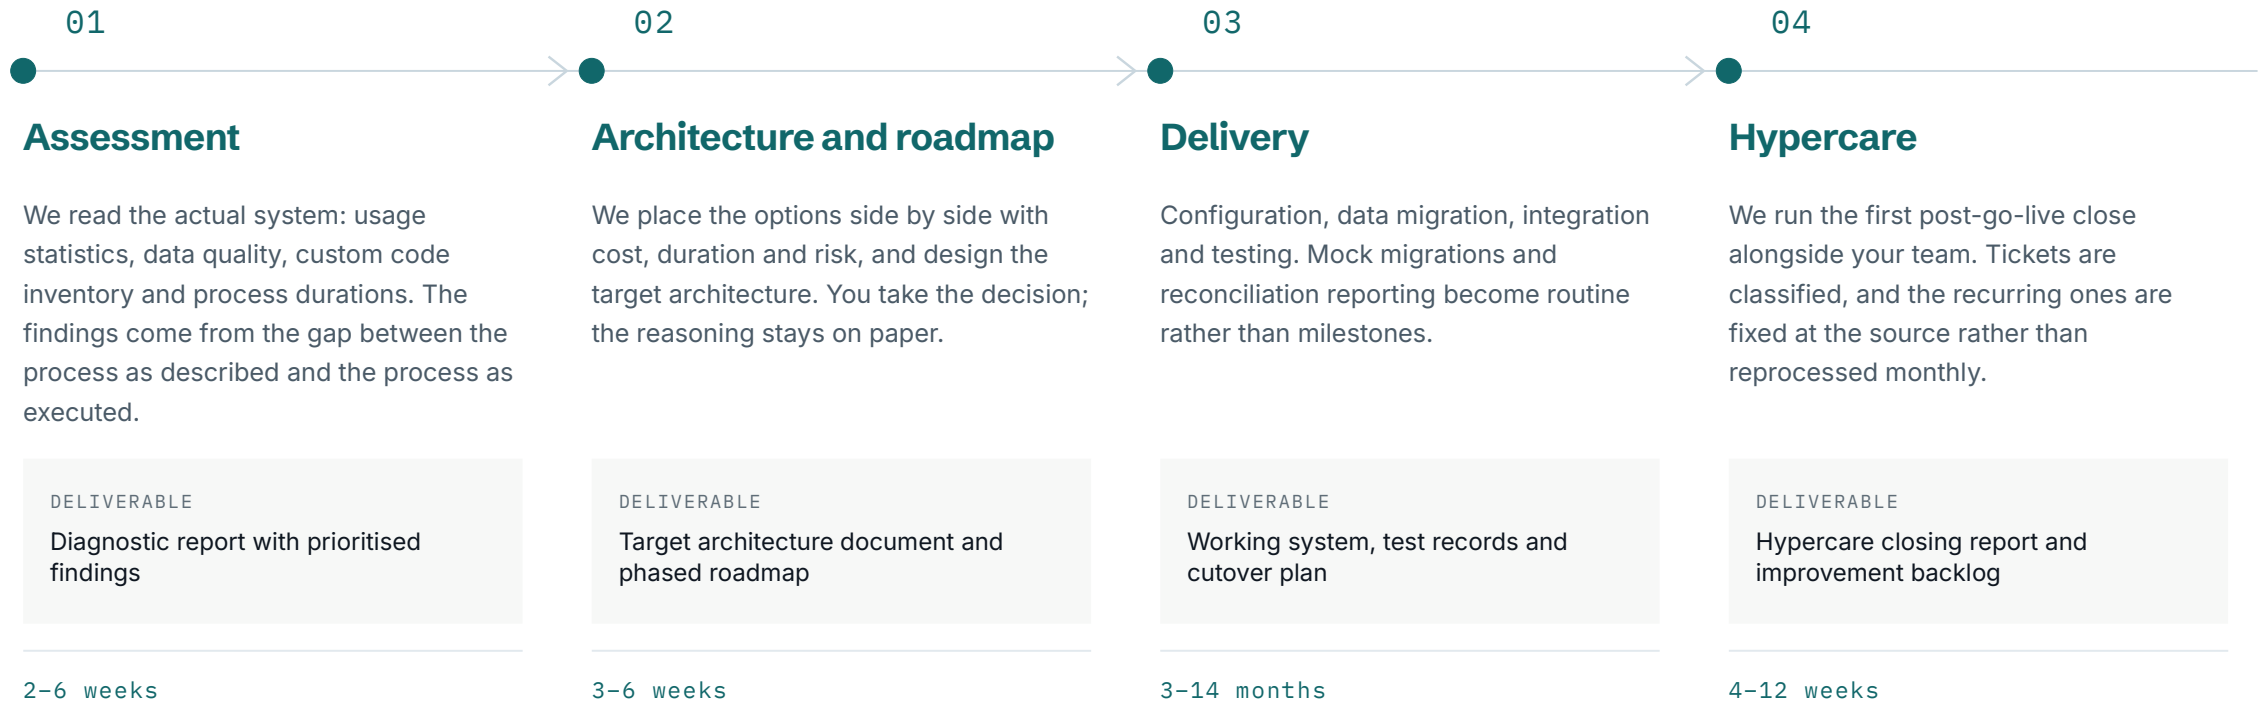

When it becomes clear an estimate will not hold, you hear it that week rather than in the month-end report.

Phase the work, don't grow the team

Each phase ends in something that works, and the decision to continue gets taken again.

Four stages, each ending in something tangible

What gets delivered at the end of each stage is defined before it starts, and no stage begins before the previous one has closed.

We use AI on both sides: in your processes and in how we work

Not a separate service line, but part of both the system we deliver and the method we use to deliver it.

IN YOUR FINANCE PROCESSES

Automation your team keeps

- Intelligent matching of bank and open items
- Anomaly detection before the close, not after
- Predictive accounting during the period
- Joule for natural-language querying

IN OUR OWN DELIVERY

Preparation work, compressed

- Custom code inventory and impact analysis
- First drafts of test scenarios
- Migration reconciliation checks
- Initial configuration documentation

SAP

Our position. Every step touching client data runs inside boundaries agreed in advance, and no decision producing a financial posting is finalised without human review.

What the work looks like in practice

Three situations we meet regularly, and the approach we take to each.

ILLUSTRATIVE — NOT CLIENT CASES

Manufacturing

MULTI-ENTITY GROUP, SEVERAL COUNTRIES

SITUATION

A group running ECC needs an S/4HANA plan before maintenance deadlines force one. Nobody knows how much accumulated custom code is still executed.

APPROACH

A usage-based custom code inventory first. All three conversion routes compared on cost, duration and risk. Company codes planned in waves.

OUTCOME

A reasoned approach decision that survives board scrutiny, and a smaller conversion scope once dead development is retired.

Technology and services

FAST-GROWING MID-MARKET COMPANY

SITUATION

The company is scaling quickly while finance still runs on spreadsheets. A standard ERP deployment is wanted, but whether Public Cloud suffices is unknown.

APPROACH

Processes compared against standard scope item by item. Fit-to-standard workshops retire differences that exist only through habit.

OUTCOME

A finance setup built on standard and ready for the release cycle, plus a deployment template that repeats in new markets.

Retail

MULTI-SITE, HIGH TRANSACTION VOLUME

SITUATION

The month-end close runs long and unpredictably. Reconciliation is largely manual, and unmatched items depend on two or three people.

APPROACH

The close measured step by step to find the dependencies creating wait time. Matching thresholds calibrated against real data.

OUTCOME

A close calendar that is predictable step by step, with the team moving from matching items to reviewing exceptions.

These contain no client names, figures or outcome claims. They are written to show how an engagement works.

The difference is who actually does the work

In SAP consulting the outcome is decided less by methodology than by who actually works on the project.

01

Real depth in the finance modules

FI and CO are our core discipline, not a capability brought along beside something else. On decisions that are expensive to reverse — enterprise structure, costing design, the close calendar — you get the view of someone who has lived the consequences several times.

02

Neutral on the cloud model

We do not advocate for Public or Private Cloud. We compare your processes against standard scope and put the cost and constraint of both models side by side for your specific situation.

03

Delivery accelerated by AI

We use AI for the volume work: analysis, documentation, test scenario generation and migration reconciliation. It shortens the preparation phases and leaves senior time for the parts that require judgement.

04

Senior consultants on every engagement

The people named in the proposal are the people who turn up. You are not charged for a consultant's learning curve. When scope grows we phase the work rather than inflate the team.
