

COMPANY OVERVIEW

10+ years of SAP finance experience and SAP cloud architecture

Deep expertise across the SAP finance modules and a genuinely neutral read on the cloud models — so the decision you take is one you can defend with its reasoning.

FINANCIAL OVERVIEW

INCOME STATEMENT (USD)

In millions	2023	2024	% Change
Revenue	\$8,426	\$9,731	+15.5%
Cost of Revenue	\$4,189	\$4,896	+16.9%
Gross Profit	\$4,237	\$4,835	+14.1%

ROE	16.8%	
ROA	10.5%	

The problem is rarely the system; it is the decisions that accumulated inside it

The sentences below are the ones we hear most often in a first conversation. None of them describe a broken system — they describe a structure that drifted.

- The close takes a different number of days every month and nobody can point to where the time goes.
- FI and CO disagree, and the reconciliation happens manually outside the system.
- Every advisor gives a different answer to brownfield versus greenfield, and none of them show their reasoning.
- Whether Public Cloud is “enough” gets debated at length while the actual processes are never compared to the standard scope.
- Errors are found after the close, when correction costs more than prevention would have.

FROM FRAGMENTED FINANCE TO A UNIFIED ARCHITECTURE

Data, processes, controls, and reporting come together in one system.

What these decisions share is that reversing them is expensive

THE CLOSE

Finance is the least forgiving area of an ERP: a decision made in the chart of accounts constrains group reporting three years later.

CONVERSION ROUTE

That single decision sets the duration, the cost and the technical debt you carry for the next decade.

CLOUD MODEL

The trade works very well for the right organisation and becomes obvious halfway through the project for the wrong one.

FINDING OUT LATE

On a slipping project the expensive part is rarely the slippage itself — it is finding out late.

Each of these is decided once, early, and paid for over years. That is the whole argument for measuring before recommending.

So we kept the scope narrow: finance modules and cloud architecture

An independent consultancy working end to end on the finance modules across SAP ECC, S/4HANA, Private Cloud and Public Cloud. Taking an engagement means not subcontracting the difficult part of it.

FOUNDED 2021 · ISTANBUL · TÜRKİYE, EMEA AND THE UNITED STATES

01	02	03	04
Real depth in the finance modules	Neutral on the cloud model	Delivery accelerated by AI	Senior consultants on every engagement
FI and CO are our core discipline, not a capability brought along beside something else. On decisions that are expensive to reverse you get the view of someone who has lived the consequences several times.	We do not advocate for Public or Private Cloud. We compare your processes against standard scope and put the cost and constraint of both models side by side for your situation.	We use AI for the volume work: analysis, documentation, test generation and migration reconciliation. It shortens the preparation phases and leaves senior time for judgement.	The people named in the proposal are the people who turn up. You are not charged for a consultant's learning curve, and when scope grows we phase the work rather than inflate the team.

REFERENCES

All four deployment models resolve to the same finance core

DEPLOYMENT MODELS

SAP ECC

The landscape most programmes start from

S/4HANA on-premise

Own infrastructure, full flexibility

Cloud ERP Private Edition

RISE with SAP — cloud operations, flexibility retained

Cloud ERP Public Edition

Standard scope, rapid deployment

SAP FINANCE CORE

FI • CO • PA • PS

- Enterprise structure and global chart of accounts
- Controlling, costing and profitability
- The financial close, redesigned step by step
- Statutory and management reporting from one source

EMBEDDED AI CAPABILITIES

Intelligent matching

Bank and open items cleared from learned behaviour

Anomaly detection

Unusual postings flagged before the close, not after

Predictive accounting

Not-yet-final transactions visible during the period

Joule

A natural-language layer for querying and navigation

SERVICE AREAS

SAP Finance Modules • S/4HANA Transformation • SAP Public Cloud • SAP Private Cloud • AI in Finance

We take no side on the cloud model; we measure and place them side by side

Not the advanced and the cheap version of one another, but different trades.

Cost model

PUBLIC Subscription by user and scope; upgrades included.

PRIVATE Varies with sizing; upgrade testing stays with you.

Extensibility

PUBLIC Core cannot be modified; extension in a separate layer.

PRIVATE Core modification allowed; existing ABAP carried across.

Upgrade cadence

PUBLIC Regular, automatic and not deferrable.

PRIVATE You control the timing; each upgrade its own project.

Implementation time

PUBLIC 3–5 months for a single-country finance deployment.

PRIVATE Typically 7–14 months, by scope and inherited landscape.

Typical fit

PUBLIC Mid-market organisations close to standard.

PRIVATE Larger organisations with customisation history.

We do not advocate for a model. We compare your processes against standard scope and put the cost and the constraint of both models side by side for your situation. The decision stays yours.

We use AI on both sides: in your processes and in how we work

SAP's AI capabilities are embedded in the system rather than bought separately. Enabling all of them is not a strategy — we assess which ones your data volume and process discipline can support, and sequence them.

IN YOUR FINANCE PROCESSES

Automation your team keeps

- Intelligent matching of bank and open items
- Anomaly detection before the close, not after
- Predictive accounting during the period
- Joule for natural-language querying

IN OUR OWN DELIVERY

Preparation work, compressed

- Custom code inventory and impact analysis
- First drafts of test scenarios
- Migration reconciliation checks
- Initial configuration documentation

■ **Our position.** No decision producing a financial posting is finalised without human review.

Measurement first, then a decision you can defend

The outcome is decided by the weekly working discipline, not by the name of the methodology.

01

MEASURE

No recommendation is made without reading the actual system data. Advice given without measurement is a guess, and its cost falls to you.

Bad news travels immediately

When it becomes clear an estimate will not hold, you hear it that week rather than in the month-end report.

02

COMPARE

Options placed side by side with cost, duration and risk — together with our own view and the reasoning behind it.

03

DECIDE

The decision is yours and the reasoning stays on paper. That is what answers “why did we do it this way?” two years later.

Phase the work, don’t grow the team

Each phase ends in something that works, and the decision to continue gets taken again.

04

OWN

Test scenarios written together, the first close run together, documentation left in a form people actually use.

Four stages, each ending in something tangible

What gets delivered at the end of each stage is defined before it starts, and no stage begins before the previous one has closed.

TYPICAL DURATION

01	Assessment	2-6 weeks
02	Architecture and roadmap	3-6 weeks
03	Delivery	3-14 months
04	Hypercare	4-12 weeks

What each phase leaves you is a document people use, not a slide pack

What gets delivered is agreed before a phase starts, and how you see progress is fixed at the outset and not changed mid-project.

DELIVERABLES

- Diagnostic report with prioritised findings
- Target architecture, chart of accounts and enterprise structure
- Configuration documentation
- Data migration plan with reconciliation reporting
- Test scenarios and recorded test results
- Hour-by-hour cutover plan with rollback criteria
- Key user training and an operating handbook

VISIBILITY DURING THE ENGAGEMENT

- Weekly status: completed, in progress, risks, awaiting your decision
- Open decision list: who decides what, and by when
- Risk register with a named owner, impact and mitigation
- Phase-end pack: documentation, test records, acceptance criteria
- Change log: every scope change with its effect on time and cost

If the process stalls when the consultant leaves, the work was not finished. We treat that as an acceptance criterion rather than a courtesy.

Not every need calls for a full programme

We work in three shapes, and we establish which one fits during the first conversation.

Assessment	2-6 weeks	Delivery	3-14 months	Expert support	Days to weeks
You need to take a decision and lack the evidence for it: conversion approach, cloud model selection, or a health check on an existing landscape. System analysis, interviews, prioritised findings and a reasoned recommendation. You end it in a position to decide.		The decision is taken and it needs building: a transformation, an implementation or a substantial redesign. Phased plan, weekly status reporting, defined deliverables and cutover. Hypercare included.		Your team or another partner is running the programme and depth is needed in one area: a design review or a second opinion. Narrow, clearly defined scope with an agreed output. Not extended past its usefulness.	

WORK WE DECLINE

Saying what we do not do matters as much as saying what we do.

- Lead responsibility for SAP modules outside our specialism — logistics, production planning, HR
- Fixed-price transformation commitments made before an assessment
- Staff augmentation without architectural or delivery responsibility
- Software development or infrastructure operations as a service

NEXT STEP

Tell us about your project and we will come back within one business day

A few sentences on where you are today and what you are trying to solve is enough to start. The first call runs 30–45 minutes at no cost.
